

Programmable Multi Axis Controller

CK3M

Control with
nanoscale precision

Maximize your machine's performance

Performing precise linear motor drive control and nanoscale positioning, the PMAC (Programmable Multi Axis Controller) has been appreciated by manufacturers of semiconductor manufacturing equipment and other leading-edge equipment. Omron now offers a next generation motion controller CK3M that packs PMAC's superior motion control capability, multi-vendor connectivity, and flexible development capability into its compact design. The CK3M removes constraints and barriers and maximizes your machine's capabilities.

Rapid

【 Nano-level high-precision control 】

Ultra-fast calculation takes high-speed, high-precision control to a new dimension. Its overwhelming calculation speed boosts your machine's precision.

Ultra-high-speed synchronous control

The CK3M delivers world-beating*1 output speeds : 50 μ s/5 axes. Ultra-high-speed feedback control enables precise path control in precision machining.

*1. Omron survey as of March 2018.

Fast servo cycle time for precise path control

The CK3M receives a feedback value and generates a command value to adjust to the target value at a high speed, providing more precise path control.

Flexible

【 Optimize system configuration 】

You can freely use multi-vendor actuators and encoders, which maximizes your machine's performance.

Advanced encoders

The capability to accept the A/B phase signals and parallel binary signals from serial data interfaces enables high-precision positioning using advanced encoders.

Various actuators

Axes can be controlled by analog Commands(DAC) and Direct PWM. The CK3M can interface with virtually any type of motor including voice coil motors and linear motors to provide precise machine operation.

Conventional system

- Fully synchronized control is difficult because multiple controllers are used
- Available actuators are limited depending on controller

CK3M

- One controller provides high-precision synchronous control
- A wide variety of actuators can be controlled, increasing machine performance

EtherCAT® interface

The built-in EtherCAT® communications port is used to connect EtherCAT® slaves including servo drives, inverters, vision systems, sensors, and I/O. Flexible systems can be configured.

Capable

【 Continuous development through customization 】

The PMAC architecture with flexible function development capability helps you realize your ideas such as incorporation of your own algorithms.

Programming flexibility

G-Code, ANSI C, or original programming language allows you to create complex and advanced algorithms.

You can create programs to control robots that follow complex paths.

In addition to customizing standard G-Code functions, you can also incorporate your own G-Code functions.

Custom servo algorithms

Full closed loop control by servo drives can be incorporated into the controller. You can customize machine control such as vibration suppression optimized for the machine mechanism.

Easy

【 Easy to use like a PLC 】

Its compact design facilitates installation in the control panel. Unit connection without tools and DIN track mounting make installation and replacement more efficient.

Modular design

The modular design allows you to freely combine the CK3M with CK3W units to enable a variety of applications.

Tool-free connection & compact size

Units can be easily connected without tools. Its compact design*2 reduces control panel size.

Approx. $\frac{1}{3}$ volume of UMAC,
saving space in control panels.

*2. CK3W-PD + CK3M-CPU + two CK3W-AX

DIN track mounting

Units can be easily mounted on a DIN track in a control system.

High-precision control of precision mechanisms

Used in conjunction with advanced actuators, encoders, and precision mechanisms, the CK3M enables a wide variety of applications where both speed and accuracy are required.

Integrated development environment (IDE)

Power PMAC IDE

The Power PMAC IDE is an integrated development environment based on

Microsoft® Visual Studio® that development engineers use as a development platform around the world.

This IDE integrates motion programming for PMAC, motor setup and tuning, debugging, and troubleshooting.

Lightweight, sophisticated GUI provides intuitive user operations, which helps you improve application development productivity.

Microsoft® Visual Studio® based integrated development environment

Assignment settings for CPU, hardware, EtherCAT®, coordinate systems, and motors can be accessed from one screen.

ANSI C or original programming language

In addition to programming in ANSI C and C-language like original programming language, G-Code can be used to write subroutines for G-Code actions.

■ Easy tuning

Autotuning facilitates tuning of motors. You can fine tune motors through intuitive operations.

■ Simple setting

Just follow the workflow to set up motors.

■ Troubleshooting

Possible solutions to your problems are suggested.

■ Debugger

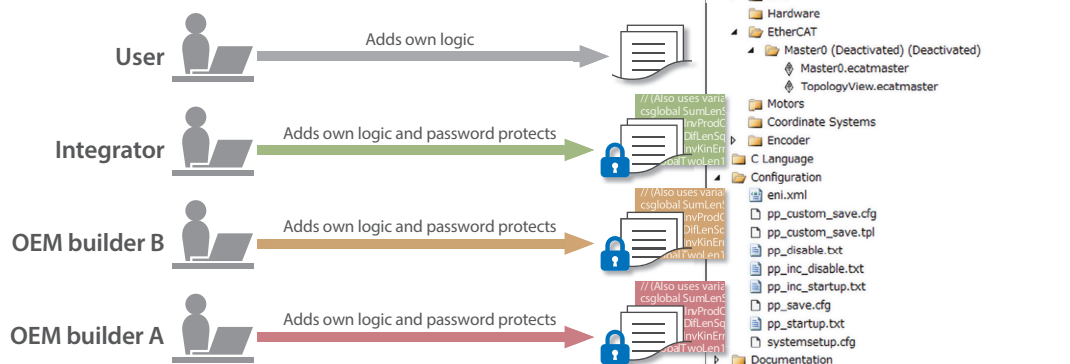

It provides the Microsoft® Visual Studio® style debugger for Script PLC programs and C background programs.

■ IP Protection

IP Protection allows engineers to protect their intellectual property by encrypting script programs

An engineer can encrypt the script programs per file and pass the project on to another engineer. The engineer who takes the project can add their own logic but cannot list or view the code encrypted by another engineer. The encryption is three-level password protected: OEM builders, independent integrators, and users can share a project securely and flexibly.

Specifications

Motion control	Max. no. of controlled axes	24 (4 axes/axial interface unit x 4 units : 16, EtherCAT : 8)
	Motion control period	50 μ s / 5 axes or more
	Control method	Analog (Filtered PWM, True DAC), pulse, Direct PWM
Interface		Ethernet port, EtherCAT [®] port (CPU option)
Feedback		AB phase, serial encoders
Memory	RAM	1 GB
	Flash	1 GB
Number of connectable CK3W Units	CPU Rack	Up to four CK3W Units (or up to two CK3W-AX Units)
	Expansion Rack	Up to four CK3W Units (or up to two CK3W-AX Units)
